Not illustrated. 1870 Excerpt: .from C, the triangle ACD can first be computed, and then CDB. This is the ambiguous case, but it is easily determined. Having computed P, if the given side a is less than P there is no solution; if = to P, one solution (a right angled triangle); if a > P and b, there are two solutions, 1. -, it will go in between CD and AC, and also beyond CD; if - P and also b there is only one solution, as it will not go in between CD and AC. 3rd. When the three given parts are all separated from each other. This is the case in which the three sides are given to find the angles. It is readily solved by letting fall a perpendicular from the angle opposite the greatest side, upon that side, as CD upon AB. Then compute the segments AD (which call m), and DB (n), from the following relation (part II, Ex. 12, page 162):  $m + n = a$ ;  $b^2 = m^2 + n^2$ . Knowing m and n, the angles of the two right angled triangles ACD and CDB can be computed, and these make known the angles of ACB. ij. B D note.--A few additional examples are here given which the pupil can use to illustrate the theory presented in (91). If more are needed the preceding can be used: these may also be used to apply the methods before given. Again, a very great variety and number...
